2023 NHSN Gastrointestinal System Infection (GI) Checklist

Documentation Review Checklist		
GI - GASTROINTESTINAL SYSTEM INFECTION		
CDI-Clostridioides difficile Infection		
Element	Element Met	Date
Clostridioides difficile infection must meet at least <u>one</u> of the following criteria:		
1. Positive test for toxin-producing <i>C. difficile</i> on an unformed stool specimen (conforms the shape of the container).	to 🛛	
 Patient has evidence of pseudomembranous colitis on gross anatomic (includes endoscopic exams) or histopathologic exam. 		
 Comments: When using a multi-testing methodology for CD identification, the result of the final to placed onto the patient medical record, will determine if GI-CDI criterion 1 is met. The date of event for CDI criterion 1 will always be the specimen collection date of the specifically, not the date of onset of unformed stool. A positive test for toxin-producing <i>C. difficile</i> and an unformed stool specimen is a sing required to meet the criterion. 	e unformed stoo	Ι,
Reporting Instructions:		
 Report the CDI and the GE or GIT <u>if</u> additional enteric organism(s) are identified and c GIT. 	riteria are met fo	or GE or
 Report each new GI-CDI according to the Repeat Infection Timeframe (RIT) rule for HA definitions in <u>Chapter 2</u> for further details and guidance). 	Als (see NHSN HA	d
• CDI laboratory-identified event (LabID Event) categorizations (for example, recurrent assay, healthcare facility-onset, community-onset, community-onset healthcare facilit to HAIs, including <i>C. difficile</i> associated gastrointestinal infections (GI-CDI).	•	

GI - GASTROINTESTINAL SYSTEM INFECTION			
GE-Gastroenteritis (excluding C. difficile infections)			
Element	Element Met	Date	
Gastroenteritis must meet at least <u>one</u> of the following criteria:			
 Patient has an acute onset of diarrhea (liquid stools for > 12 hours) and no likely noninfectious cause (for example, diagnostic tests, therapeutic regimen other than antimicrobial agents, acute exacerbation of a chronic condition, or psychological stress information). 			
Patient has at least <u>two</u> of the following signs or symptoms:			
Nausea*			
Vomiting*			
Abdominal pain*			
• Fever (>38.0°C)			
Headache*			
AND at least <u>one</u> of the following:			
 An enteric pathogen is identified from stool or rectal swab by a culture or non- culture based microbiologic testing method, which is performed for purposes of clinical diagnosis or treatment, for example, not Active Surveillance Culture/Testing (ASC/AST). 			
b. An enteric pathogen is detected by microscopy on stool.			
 Diagnostic single antibody titer (IgM) or 4-fold increase in paired sera (IgG) for organism. 			
*With no other recognized cause documented by physician			
 Comment: The reference to "enteric pathogens" describes pathogens that are not considered to be nor intestinal tract. Enteric pathogens identified on culture or with the use of other diagnostic la include Salmonella, Shigella, Yersinia, Campylobacter, Listeria, Vibrio, Enteropathogenic or En E. coli, or Giardia. Reporting instruction: 	boratory te	ests	

• Report only GI-GIT using the event date as that of GI-GIT if the patient meets criteria for both GI-GE and GI-GIT.

GI - GASTROINTESTINAL SYSTEM INFECTION

GIT-Gastrointestinal tract infection (esophagus, stomach, small and large bowel, and rectum) excluding				
gastroenteritis, appendicitis, and C. difficile infection				
Element	Element Met	Date		
Gastrointestinal tract infections, excluding, gastroenteritis and appendicitis, must meet at least	one of the fol	lowing		
criteria:				
1. Patient has <u>one</u> of the following:				
 An abscess or other evidence of gastrointestinal tract infection on gross anatomic or histopathologic exam. 				
 Abscess or other evidence of gastrointestinal tract infection on gross anatomic or histopathologic exam (see Reporting Instructions) 				
AND				
Organism(s) identified from blood by a culture or non-culture based				
microbiologic testing method, which is performed for purposes of clinical				
diagnosis or treatment, for example, not Active Surveillance Culture/Testing				
(ASC/AST). The organism(s) identified in the blood must contain at least one MBI				
organism.				
 Patient has at least <u>two</u> of the following signs or symptoms compatible with infection o involved: 	f the organ or	tissue		
• Fever (>38.0°C)				
Nausea*				
Vomiting*				
Pain* or tenderness*				
Odynophagia*				
Dysphagia*				
AND at least one of the following:				
a. Organism(s) identified from drainage or tissue obtained during an invasive				
procedure or from drainage from an aseptically-placed drain by a culture or non-				
culture based microbiologic testing method, which is performed for purposes of				
clinical diagnosis or treatment, for example, not Active Surveillance				
Culture/Testing (ASC/AST).				
b. Organism(s) seen on Gram stain or fungal elements seen on KOH stain or				
multinucleated giant cells seen on microscopic examination of drainage or tissue				
obtained during an invasive procedure or from drainage from an aseptically-				
placed drain.				
c. Organism(s) identified from blood by a culture or non-culture based				
microbiologic testing method, which is performed for purposes of clinical				
diagnosis or treatment, for example, not Active Surveillance Culture/Testing				
(ASC/AST). The organism(s) identified in the blood must contain at least one MBI				
organism. AND				
Imaging test evidence definitive for gastrointestinal infection (for example,				
endoscopic exam, MRI, CT scan), which if equivocal is supported by clinical				
correlation, specifically, physician documentation of antimicrobial treatment for				
gastrointestinal tract infection.				
d. Imaging test evidence definitive for gastrointestinal infection (for example,				
endoscopic exam, MRI, CT scan), which if equivocal is supported by clinical				

 correlation, specifically, physician documentation of antimicrobial treatment for gastrointestinal tract infection.

 *With no other recognized cause documented by physician

 Reporting instructions:

 • Report only GI-GIT using the event date as that of GI-GIT if the patient meets criteria for both GI-GE and GI-GIT.

 • For GIT 1b: If an organism is identified on histopathologic exam, the blood specimen must contain a matching organism.

 • In patients > 1 year of age, pneumatosis intestinalis is considered an equivocal imaging finding for a

gastrointestinal tract infection (GIT). For patients \leq 1 year of age, please review the NEC criteria.

GI - GASTROINTESTINAL SYSTEM INFECTION

IAB-Intraabdominal infection, not specified elsewhere, including gallbladder, bile ducts, liver (excluding
viral hepatitis), spleen, pancreas, peritoneum, retroperitoneal, subphrenic or subdiaphragmatic space, or
other intraabdominal tissue or area not specified elsewhere

Elemer	nt		Element Met	Date
Intraab	odomi	nal infections must meet at least <u>one</u> of the following criteria:		
1.	intra whic	ent has organism(s) identified from an abscess or from purulent material from abdominal space by a culture or non-culture based microbiologic testing method, th is performed for purposes of clinical diagnosis or treatment, for example, not ve Surveillance Culture/Testing (ASC/AST).		
2.	Patie	ent has at least <u>one</u> of the following:		
۷.		Abscess or other evidence of intraabdominal infection on gross anatomic or		
		histopathologic exam.		
		Abscess or other evidence of intraabdominal infection on gross anatomic or histopathologic exam (see Reporting Instruction)		
	A٨			
		Organism(s) identified from blood by a culture or non-culture based microbiologic testing method, which is performed for purposes of clinical diagnosis or treatment, for example, not Active Surveillance Culture/Testing (ASC/AST). The organism(s) identified in the blood must contain at least one MBI organism.		
3.	Patie	ent has at least <u>two</u> of the following:		
	٠	Fever (>38.0°C)		
	٠	Hypotension		
	٠	Nausea*		
	٠	Vomiting*		
	٠	Abdominal pain or tenderness*		
	•	Elevated transaminase level(s)*		
	٠	Jaundice*		
<u>A</u>	ND at	least <u>one</u> of the following:		
	a.	Organism(s) seen on Gram stain and/or identified from intraabdominal fluid or tissue obtained during invasive procedure or from an aseptically-placed drain in the intraabdominal space (for example, closed suction drainage system, open drain, T-tube drain, CT-guided drainage) by a culture or non-culture based microbiologic testing method, which is performed for purposes of clinical diagnosis or treatment, for example, not Active Surveillance Culture/Testing (ASC/AST).		
	b.	Organism(s) identified from blood by a culture or non-culture based microbiologic testing method, which is performed for purposes of clinical diagnosis or treatment, for example, not Active Surveillance Culture/Testing (ASC/AST). The organism(s) identified in the blood must contain at least one MBI organism.		
	А٨			
		Imaging test evidence definitive for infection (for example, ultrasound, CT scan, MRI, ERCP, radiolabel scans [gallium, technetium, etc.], or on abdominal x-ray), which if equivocal is supported by clinical correlation, specifically, physician documentation of antimicrobial treatment for intraabdominal infection [†] .		

*With no other recognized cause documented by physician

Reporting instructions:

- **†**Biliary ductal dilatation is considered an equivocal finding for cholangitis.
- For IAB 2b: If an organism is identified on histopathologic exam, the blood specimen must contain a matching organism.
- Do not report pancreatitis (an inflammatory syndrome characterized by abdominal pain, nausea, and vomiting associated with high serum levels of pancreatic enzymes) unless it is determined to be infectious in origin.
- Eligible laboratory results that represent transaminase levels include serum glutamic oxaloacetic transaminase (SGOT), serum glutamic pyruvic transaminase (SGPT), alanine transaminase (ALT), or aspartate transaminase (AST). Consider the requirement for elevated transaminase level(s) met if at least one is elevated as per the normal range provided by the laboratory.

GI - GASTROINTESTINAL SYSTEM INFECTION		
NEC-Necrotizing enterocolitis		
Element	Element Met	Date
Necrotizing enterocolitis in infants (≤1 year of age) must meet <u>one</u> of the following criteria:		
1. Infant has at least <u>one</u> of the clinical and <u>one</u> of the imaging test findings from the lists below	sw:	
At least <u>one</u> clinical sign:		
 Bilious aspirate (Note: Bilious aspirate from a transpyloric feeding tube should be excluded.) 		
b. Vomiting		
c. Abdominal distention		
d. Occult or gross blood in stools (with no rectal fissure)		
And at least <u>one</u> imaging test finding which if equivocal is supported by clinical correlation	on (specifica	ally,
physician documentation of antimicrobial treatment for NEC):		
a. Pneumatosis intestinalis.		
b. Portal venous gas (Hepatobiliary gas).		
c. Pneumoperitoneum.		
Surgical NEC: Infant has at least <u>one</u> of the following surgical findings:		
a. Surgical evidence of extensive bowel necrosis (>2 cm of bowel affected).		
b. Surgical evidence of pneumatosis intestinalis with or without intestinal perforation.		
 Reporting instructions: Necrotizing enterocolitis (NEC) criteria include neither a site-specific specimen nor organism blood specimen. A BSI is considered secondary to NEC if the patient meets one of the two organism identified from blood specimen collected during the secondary BSI attribution per pathogen, or the same common commensal is identified from two or more blood specimen occasions collected on the same or consecutive days. 	NEC criteria eriod is an L	a <u>AND</u> an CBI
 Pneumatosis is considered an equivocal abdominal imaging finding for necrotizing enteroc Examples of abdominal imaging include KUB, ultrasound, or an abdominal x-ray. NEC criteria cannot be met in patients > 1 year of age. Review GIT for eligibility. 	olitis.
