## INTRODUCTION

The adjustment of the fluoride content of community water supplies to an optimal level as a method to prevent tooth decay began in January 1945 in Grand Rapids, Michigan. At the present time, over 121 million citizens in more than 7,700 communities throughout the Nation are receiving the benefits of optimally adjusted fluoridated water. An additional 9 million people in 1,909 communities are using water with naturally occurring fluoride at levels of 0.7 parts per million or higher. Therefore, 40 years after the first water system was fluoridated, more than 53 percent of the Nation's population has access to water with a dentally significant concentration of fluoride.

The Centers for Disease Control (CDC) contracted with Alliance Technologies Corporation to collect data to determine the current population, location, and status of communities in the United States using optimally adjusted or naturally occurring fluoridated water. These data were provided to Alliance Technologies Corporation by State and Territorial Dental Health Directors. The tabulation of the data, as they appear in this publication, revises and updates previous editions of the Fluoridation Census.<sup>1</sup>

Adjusted fluoridation is the conscious maintenance of the optimal fluoride concentration in the water supply for preventing dental caries. The optimal concentration may be accomplished by adding fluoride chemicals to fluoride deficient water; by blending two or more sources of water naturally containing fluoride to achieve the optimal concentration; or by partial defluoridation, that is, removing naturally occurring excessive fluorides to obtain the recommended level. Water systems are considered to have dentally significant natural fluoridation if they contain 0.7 parts per million (ppm) or more of naturally occurring fluoride. Water systems and communities with optimally adjusted fluoride and naturally occurring fluoride in water are listed in this publication. Adjusted water systems are fluoridated at the optimal level according to the average maximum daily air temperature in the community. (Recommended concentrations, according to National Interim Primary Drinking Water Regulations, 1975, are shown on Table A.) Although the term natural fluoridation has no particular scientific or official connotation, it has been used in this publication for the sake of simplification.

**TABLE A**  
**RECOMMENDED OPTIMAL FLUORIDE LEVEL**

| Annual Average of Maximum Daily Air Temperatures <sup>1</sup> (°F) | Recommended Fluoride Concentrations |                           | Recommended Control Range |             |                |            |
|--|-------------------------------------|---------------------------|---------------------------|-------------|----------------|------------|
|  |                                     |                           | Community Systems         |             | School Systems |            |
|  | Community (ppm)                     | School <sup>2</sup> (ppm) | 0.1 Below                 | - 0.5 Above | 20% Low        | - 20% High |
| 40.0 - 53.7  | 1.2                                 | 5.4                       | 1.1                       | - 1.7       | 4.3            | - 6.5      |
| 53.8 - 58.3  | 1.1                                 | 5.0                       | 1.0                       | - 1.6       | 4.0            | - 6.0      |
| 58.4 - 63.8  | 1.0                                 | 4.5                       | 0.9                       | - 1.5       | 3.6            | - 5.4      |
| 63.9 - 70.6  | 0.9                                 | 4.1                       | 0.8                       | - 1.4       | 3.3            | - 4.9      |
| 70.7 - 79.2  | 0.8                                 | 3.6                       | 0.7                       | - 1.3       | 2.9            | - 4.3      |
| 79.3 - 90.5  | 0.7                                 | 3.2                       | 0.6                       | - 1.2       | 2.6            | - 3.8      |

<sup>1</sup>Based on temperature data obtained for a minimum of five years.

<sup>2</sup>Based on 4.5 times the optimum fluoride level for communities

## METHODOLOGY

A computer printout of the fluoridation status for each State as it was collected for the 1980 Fluoridation Census was forwarded to the Director, Division of Dental Health (or the equivalent), in every State health department as a guide to updating information for the 1985 Fluoridation Census. They were requested to update, change, and verify the information presented and to include new fluoridation installations while deleting those that were inappropriate. A request was made to update the population figures to reflect 1985 census estimates. This information was then submitted in a different format for the 1985 Fluoridation Census: States were asked to report each fluoridated water system and the communities each system served; the status of fluoridation, adjusted, consecutive, or natural; the system from which water was purchased, if consecutive; the population receiving fluoridated water; the date on which fluoridation started; and the chemical used for fluoridation, if adjusted.

The updated information was returned to Alliance Technologies Corporation where a master file was created to incorporate the new format and to reflect changes made in the previous data provided by State health officials. The dental directors were informed that unless they made specific changes in their State's printout, the data on the existing printout would be used in the publication of the 1985 Fluoridation Census. In essence, this publication is a report of the Status of Fluoridation made by the States, and the data herewith reported has been provided by the individual States.
