DGHP'S IMPACT AROUND THE WORLD

BY THE NUMBERS

In today's interconnected world, a pathogen can spread to every major city—including in the U.S.—within **36 hours**. CDC is America's first line of defense against global health threats. As an essential component of CDC's **global health security** efforts, the Division of Global Health Protection (DGHP) works across CDC and with country partners to tackle outbreaks and strengthen the health systems that allow us to stop disease threats before they reach the U.S.

In just two years, DGHP-affiliated staff and systems, working in collaboration with country partners, have had the following impact worldwide:

Rapid response to

MORE THAN 250 OUTBREAKS

helping communities contain deadly threats before they could spread

Empowering the next generation of global health leaders by training

NEARLY 2,000 DISEASE DETECTIVES

across the world

Strengthening

50+ SURVEILLANCE SYSTEMS

giving countries the tools to detect and stop diseases faster

DGHP's work is critical. Without it, dangerous diseases will spread unchecked, putting American lives at risk. Our ability to fight these threats not only stops outbreaks before they can reach U.S. shores—it strengthens countries' ability to manage public health emergencies, reduces long-term reliance on external aid, and **keeps Americans safe—both around the world and at home.**
