

How to Create a County Profile Report

Step 1 To get started, follow the instructions for making a state map of local-level data using the [Atlas of Heart Disease and Stroke](#).

Note: County profiles are only available for maps of mortality and hospitalization data.

Step 2

On the map, click on the county of interest. A pop-up box will appear to show the rate for the county along with options to view a) tables related to the county or b) a detailed county profile.

Step 3

Select **View Detailed County Profile** to access a webpage with county-specific information about the rates for each racial/ethnic group, the distribution of demographic groups, and a table with social and economic data. A new window will open with the county profile, which will automatically be downloaded as a PDF.
