Variable:	BMI
Label:	DERIVED: Body Mass Index (BMI)
Notes:	BMI was calculated using the in-house version of the height and weight variables, which contain the greater range of height and weight values than are available on the public use file. The range of possible BMI values listed (1-99.95) does not reflect actual calculated BMI values at the extremes of the range, but rather, allows for the theoretical possibility of such unlikely values. BMI = [Weight (kg)/[Height (m) squared]] rounded to 2 decimal places. Conversion factors: 1 kilogram (kg) = 2.20462 pounds; 1 meter (m) = 39.37008 inches. Extreme weights (<50lbs or >500lbs) and heights (<24 in. or >95 in.) were excluded for the calculation. BMI is topcoded at 99.95. This variable was included in the questionnaire for benchmarking purposes as gold standard sources of this measure exist elsewhere. Please exercise caution when using this variable as an outcome of interest.
